Tasks:

1.What is the advantage of virtualization over dual boot?

The advantage of virtualization over dual boot is that we are able to use our both operating system at the same time without reloading the operating system of computer.

2.What is the difference between a directory and subdirectory?

Directory: A file where sub directories and other files are present or found.

Sub Directory: A directory within another directory

3.Why does the relative path depend on the current directory?

A relative path depends on the state of the user that's why it describes the location of a file with respect to current directory rather than using root directory.

4.Why does the absolute path always start with /?

The absolute paths start from root directory rather than using user current directory and in Ubuntu root directory is / so the absolute path will look like /home/noor/Download/file.txt

5.How is the home directory different from the root directory?

Home directory is the directory Linux choose as working directory when user logs in. This directory name matches with mostly our login name while root directory is where we start our directories from, after this we find a default directory called home.
